
The Prime Minister

10 Downing Street, London SW1A 2AA

Dear Prime Minister,

AI now poses extremely serious risks to our national security.

In a series of incidents this summer, a “swarm” of OpenAI agents created secret messaging channels and hacked into the infrastructure of another AI company, and OpenAI itself, without OpenAI being aware. These attacks would have constituted criminal offences if they had been performed by humans. Yet no one has been held accountable to date.

The cyber capabilities of frontier AI systems are progressing rapidly. If they are ever turned against our critical national infrastructure (water, electricity, hospitals, and banks), the consequences will be grave. More severe threats from AI are also visible on the horizon, including the development of bioweapons and the subversion of human control.

The Government’s cyber security legislation is welcome, but it primarily defines defensive requirements for the operators of essential services. We must also address the source of these increased threats. When models are used to perform sophisticated attacks, or when they carry out attacks of their own accord, developers must share responsibility.

Today, the UK has no specific legal standards for frontier AI safety. No regulator oversees frontier AI development, and UK law does not reliably hold developers liable for damage or deaths caused by their models, even when the danger is predictable, preventable, and uniquely enabled by AI.

Given the pace at which AI capabilities are advancing, this matter cannot wait. We urge you to introduce legislation to address the risks of frontier AI development.

Yours sincerely,
